

iAsset

Enterprise Asset Management System

PERI is pleased to announce the launch of its Enterprise Asset Management System – iAsset. Built using open source framework, iAsset is a portal based application that allows the same to be rapidly deployed and accessed from anywhere having broadband connectivity. iAsset enables our clients to manage their vast inventory, even if the same is spread across multiple geographical locations.

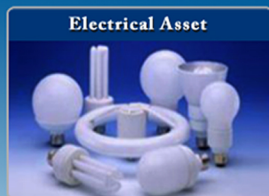

iAsset is an all-in-one solution, effectively addressing the asset management needs of any department – be it Government, Corporate or small and medium businesses. It helps improve efficiency and reduces costs by enabling the user to keep an accurate track of all the assets.

iAsset helps to keep a regular and frequent track of all assets and helps prevent loss and misuse of the assets. The application helps to keep a regular track of assets that are moved from one location to another, sent for repair, leased or rented out, lost, broken, junked or sold, etc.

iAsset permits the user to gain control over his assets and saves on time and money for the department. It allows the user to make intelligent purchases based on accurate information of the availability, usability of an asset and its actual need. The user can also track maintenance contracts, plan for easy and quick extension of maintenance, track history of any upgrades, fixes for an asset among others.

iAsset allows assets to be categorized and grouped under various customizable formats. With specific reference to funded projects, it is mandated by the funding agency to keep accurate and auditable records of all the assets purchased under the project. Regular audits are mandated by the agency and the need is to provide verifiable records in a structured format.

Key Features

- List of asset(s), Asset Location, Asset custodian
- Issue Date, When it is due for return
- When it is scheduled for maintenance
- The cost and depreciation
- Current book value
- The warranty period and expiration
- Contrast management
- Detailed tracking of computers, searchable by all fields
- Software tracking (installed copies, licensing)
- Trouble ticket system ("tracking") with priorities, assign to users
- Transaction tracking history, follow-ups
- Scaleable to thousands of records
- Full e-mail notification
- Report generation tools

Key Benefits

- Know what assets your company owns and which employee or client has them.
- Know the locations of your assets
- Classify assets based on customizable parameters with sub categories, types, class, etc
- Reduce software spending by knowing how many software licenses you own and how many are not being used.
- Improve the tracking and documentation of multipart assets (e.g., components within a server, components of medical equipments, school equipments).
- Enables purchase decision by knowing the Replacement and Realisation Value of the assets
- Know the cost of your assets and depreciation amounts.
- Know the book value of your entire asset by company or department.
- Spend less time searching for your equipment and assets.
- Reduce "borrowing" without permission, alerts when borrowed items are not returned within due dates
- Know who is responsible for maintaining assets, changes made (if any)
- Keep track of maintenance contracts, expiry dates, renewals
- Project wise reporting capability – optional and customisable.
- Generate reports based on customizable parameters – department wise, location wise, category wise, value wise, purchase date wise, etc.
- Project wise reporting capability – optional and customisable.
