

iFleet

Enterprise Fleet Management System

Every organisation either owns or contracts a large number of vehicles for easy movement of their employees. Vehicles are used to pick up and drop employees working in different shifts as well as for delivery of goods. The cost of managing and maintaining such fleets – be it 10 or 100 or 300 – is very expensive and time consuming. Outsourcing of the fleet to third party transport agencies has only increased the administrative costs. In addition, security and safety of its personnel has added a new dimension to an organisations ability to track and record the movements of its employees and its fleet.

In order to enable our clients to meet the growing demands of management of the vehicles and their staff, **PERI** is proud to announce the launch of its Open Source based Enterprise Fleet Management System – iFleet. iFleet enables our clients to pro-actively manage their large fleet of vehicles and gather intelligence reports on their usage. Built using open source framework, iFleet is a portal based application that allows the same to be rapidly deployed and accessed from anywhere having broadband connectivity.

iFleet is an effective tool for any organisation that has multiple vehicles for the usage of its employees, thereby increasing efficiency of vehicle usage and reducing costs. Whether the vehicles are company owned or contracted to third party agencies, iFleet enables the organisation to keep an accurate track of the movement of the vehicles, its usage, the routes taken, services required, agencies providing such service, among others.

iFleet permits secure access to authorised users only, thereby ensuring information is easily accessible only to the relevant personnel and departments.
